

Hostel Maintenance & Issue Ticketing System

• Use-Case Flow Specification:

Use Case	UC-07: Track SLA Timeline & Escalation
Primary Actor	Maintenance Warden
Secondary Actor	Hostel Administrator (notified on escalation)
Related Use Case	<<extend>> UC-08: Escalate Overdue Ticket
Preconditions	A ticket has been logged (FR-001) and assigned to a Maintenance Warden (FR-002), with an SLA deadline set from its priority level (High priority).
Postconditions	Success: the ticket is Resolved within its SLA window and the timeline is closed as “SLA Met.” Failure: the ticket is flagged “SLA Breached,” an escalation record is created, and the Hostel Administrator is notified.

Main Success Scenario

1. System starts the SLA timer the instant the ticket's status changes to “Assigned.”
2. System calculates the SLA deadline from the ticket's priority (e.g., High = 24 hours, Medium = 72 hours).
3. Warden (or assigned staff) works the issue and updates the status to “In Progress.”
4. Warden resolves the issue and updates the status to “Resolved” before the SLA deadline.
5. System stops the SLA timer and logs the total resolution time against the ticket.
6. System marks the ticket “SLA Met” on the tracking dashboard.
7. Use case ends successfully; ticket proceeds to resident sign-off (UC-06).

Alternate Flow — 4a. SLA Breach(“IN CASE OF ERROR”)

- 4a1. The SLA deadline passes while the ticket is still “Assigned” or “In Progress.”
- 4a2. System automatically flags the ticket “SLA Breached” and triggers UC-08: Escalate Overdue Ticket (<<extend>>).

4a3. System sends an SMS / Email alert to the Hostel Administrator and the Warden (NFR-001).

4a4. Administrator reviews the ticket and may reassign it to another staff member or raise its priority.

4a5. Once the ticket is resolved, the system logs the breach duration for SLA reporting and the use case rejoins the main flow at step 6
